

# U3:L4 QUADRATIC SOLUTIONS AND ROOTS

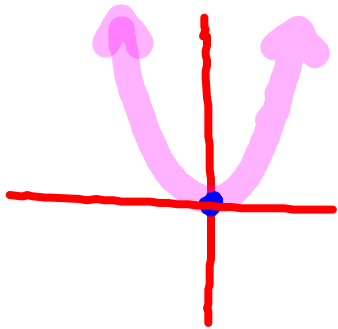

“Solving” quadratic equations is synonymous with finding roots of the quadratic equation. This happens when...

$$0 = ax^2 + bx + c$$

When you solve for  $y=0$ , you are finding the  $x$  intercepts of the parabola.

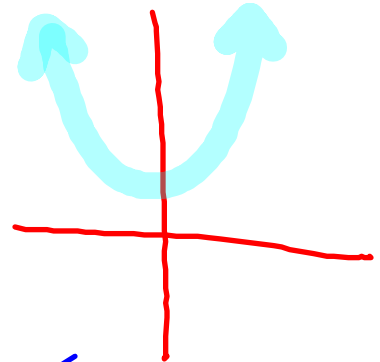

There are three options of solving quadratics. You can either have...

1 ROOT

2 ROOTS

$\emptyset$  ROOTS

There are two different methods for solving the roots:

- 1) Table of values + graph
- 2) Desmos App

Once solved, you can verify the roots by plugging the x-values back into the original quadratic equation when  $y=0$ .

Try on Desmos:

a)  $f(x) = -x^2 + 8x - 16$

b) Verify by plugging the x-values back in...

$$\begin{aligned}y &= -x^2 + 8x - 16 \\0 &= -(4)^2 + 8(4) - 16 \\0 &= -16 + 32 - 16 \\0 &= 16 - 16 \\0 &= 0 \checkmark\end{aligned}$$

1 ROOT  
(4,0)

Try by graphing on your own:

a)  $f(x) = x^2 - 6x + 9$

+a OPEN ↑  
C y intercept (0,9)

x	Y
0	9
1	4
2	1
* 3	0
4	1
5	4
6	9
7	

1 ROOT @ (3,0)

$$y = x^2 - 6x + 9 \leftarrow$$

$$0 = (3)^2 - 6(3) + 9$$

$$0 = 9 - 18 + 9$$

$$0 = -9 + 9$$

$$0 = 0 \checkmark$$

Solve the roots:

a)  $2x^2 + x = -2$

\*What is the essential first step?

Solve for  $y=0$   
★ Rearrange the equation

$$2x^2 + x + 2 = 0$$

x	y
-2	6
-1	3
0	2
1	3
2	6
